Introduction & Objectives

Introduction

This report covers the “CIS Club” website— a multi-page web app for the Computer & Information Systems Club at Daffodil International University. The site works as the main online hub for the club. It’s built with semantic HTML5, CSS3 (Flexbox + Grid), and vanilla JavaScript. The design is modern, responsive, and easy to navigate.

Objectives

The website aim is to:

- Share clear information about the club’s mission, history, and leadership.
- Help new students join through a simple registration page.
- Provide learning resources like tutorials, projects, and software suggestions.
- Build community through an events page and photo gallery.
- Make the club easy to contact through forms and a location map.

Site Structure (Navigation Flow)

The site follows a simple hierarchy with a common navigation bar on all pages. The **Home** page connects to six main sections. The **Events** page also links to event-specific detail pages.

Navigation Layout:

- **Home (index.html)**
 - About
 - Mission & History
 - Leadership
 - Events
 - Upcoming Events
 - Event Details
 - Join
 - Benefits
 - Registration Form
 - FAQ

- Resources
 - Projects
 - Tutorials & Tools
- Gallery
 - Photo Grid
 - Lightbox
- Contact
 - Contact Form
 - Map

3. Browser Test Results

Feature	Chrome (Blink)	Firefox (Gecko)	Status
Flexbox/Grid	Works perfectly	Works perfectly	Pass
Backdrop Filter	Smooth glassmorphism	Supported, works fine	Pass
Form Validation	Chrome-style popups	Firefox-style popups	Pass
Font Rendering	Slightly bolder	Slightly sharper	Minor Difference
Media Queries	Mobile breakpoint works	Same behavior	Pass

Test Setup:

- Browser 1: Chrome
- Browser 2: Firefox
- 1920×1080 desktop + 375×667 mobile

Main Differences:

Most changes come from each browser's default stylesheet.

- Chrome shows a blue focus outline; Firefox uses a different style.
- Scrollbars look different because Chrome supports WebKit styling but Firefox uses standard properties.

Critical Evaluation

The website follows modern standards well. Semantic HTML5 improves accessibility and SEO. CSS Variables keep the theme consistent, and Flexbox/Grid make the site fully responsive. The gallery, lightbox, and filtering features are handled with plain JavaScript, which keeps the site fast and lightweight.

But there are a few issues:

- The header and footer are copied on every page, which breaks DRY (Don't Repeat Yourself). Using components or server-side includes would fix this.
- Images should include width and height attributes to reduce layout shifting during loading.
